EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 9th JANUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the first week of the year numbered 6,750 corresponding to an annual rate of 16·8 per 1,000 living: stillbirths numbered 261 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 7,034 (226 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 69, against 59, 46 and 78 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 57, 97, 325 and 768 respectively.

In **London** (Administrative County including the City of London) there were 1,196 live births registered corresponding to an annual rate of 14·9 per 1,000 living: stillbirths numbered 41 corresponding to a rate of 33 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,948 (177 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 83 against 54, 38 and 103 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·99 ins. at the beginning of the week to 30·16 ins. by 20h. on 3rd: decreased to 29·71 ins. by 20h. on 4th; increased to 29·96 ins. by 16h. on 5th; decreased to 29·49 ins. by 14h. on 6th; increased to 30·43 ins. by 22h. on 8th; decreased and was 30·26 ins. by midnight on the 9th.

The Guide to Current Official Statistics

It is the aim of the Permanent Consultative Committee on Official Statistics, in issuing this Annual Guide, to direct the enquirer to all current official publications that contain statistics bearing on his subject, and especially to inform him of the nature of the statistics he will find in the volume to which he is referred. The Guide embraces two distinct sections (i) a Subject Index and (ii) a List of Publications. It covers the whole of the statistical information contained in publications issued by Government Departments in Great Britain and Northern Ireland and is a work of obvious utility.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 16th JANUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the second week of the year numbered 6,099 corresponding to an annual rate of 15·2 per 1,000 living: stillbirths numbered 267 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 7,700 (666 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 76, against 46, 78 and 69 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 97, 325, 768 and 1,100 respectively.

In **London** (Administrative County including the City of London) there were 1,131 live births registered corresponding to an annual rate of 14·1 per 1,000 living: stillbirths numbered 46 corresponding to a rate of 39 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,996 (48 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 79 against 38, 103 and 83 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made fo changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from thos published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of th parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in th last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on th 1st April, 1936.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 16th January, 193

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30·26 ins. at the beginning of the week to 29·85 ins. by 5h. on 13th: increased to 29·99 ins. by 11h. on 14th; decreased to 29·43 ins. by 9h. on 16th; increased and was 29·70 ins. by midnight on the 16th.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 23rd JANUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the third week of the year numbered 6,046 corresponding to an annual rate of 15·1 per 1,000 living: stillbirths numbered 308 corresponding to a rate of 48 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 7,764 (62 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 70, against 78, 69 and 76 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 325, 768, 1,100 and 1,137 respectively.

In **London** (Administrative County including the City of London) there were 1,170 live births registered corresponding to an annual rate of 14·6 per 1,000 living: stillbirths numbered 37 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,711 (285 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 71 against 103, 83 and 79 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

DATE. January, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	17	Discontinued.	2·3	8·4	Cloudless till 3½h.; nearly overcast by 4h. till 9h.; very cloudy till 12h.; then overcast generally. Rain 18h. till 18½h.; and from 21½h. Damping 18½h till 19½h. Hoar frost in morning.
Monday ...	18		0·1	8·5	Overcast generally till 16½h.; few clouds till 17h.; overcast till 20h.; then cloudless by 20½h. Rain till 2h.; at 9½h.; 10½h. till 14h.; 15h. till 15½h.; and 16½h. till 17½h. Fresh wind from 11h.; rising to strong wind 17h. till 21h.
Tuesday ...	19		3·6	8·5	Nearly cloudless till 7h.; nearly overcast till 11h.; then variably cloudy. Rain 19½h. till 20½h. Fog 7h. till 9h.; then mist. Hoar frost in morning.
Wednesday ...	20		4·8	8·6	Nearly cloudless till 13h.; cloudy till 17½h.; then overcast. Rain 17½h. till 18h. Damping from 22h. Fog 7h. till 10h. Solar halo 14½h. Parhelion 15½h. Hoar frost in morning. Fresh wind from 20h.
Thursday ...	21		1·7	8·6	Overcast till 6½h.; few clouds till 10h.; then overcast generally. Rain till 2h.; then drizzle till 6½h. Shower 14h. till 14½h.; and at 20h. Drizzle from 23h. Fresh wind till 6h. and from 23h.
Friday ...	22		0·0	8·6	Overcast generally. Drizzle till 2h.; and 10½h. till 11h. Rain 2h. till 9h.; and 11h. till 14h. Occasional damping between 15h. and 16h. Fresh wind till 15h.
Saturday ...	23		0·0	8·7	Overcast generally till 19h.; nearly cloudless till 20½h.; nearly overcast till 23h.; then partially cloudy. Drizzle 4½h. till 4¾h. Rain 4¾h. till 13h.; and 18h. till 18½h. Slight rain 13h. till 13½h.; and 14½h. till 15½h. Fog 7h. till 9h.; then mist till 12h.
			Sum 12·5	Sum 59·9	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·70 ins. at the beginning of the week to 28·77 ins. by 15h. on 18th: increased to 29·64 ins. by 9h. on 20th; decreased to 29·24 ins. by 4h. on 21st; increased to 29·80 ins. by 0h. on 23rd; decreased and was 29·42 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 30th JANUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the fourth week of the year numbered 5,626 corresponding to an annual rate of 14·0 per 1,000 living: stillbirths numbered 257 corresponding to a rate of 44 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 7,457 (307 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 72, against 69, 76 and 70 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 768, 1,100, 1,137 and 1,155 respectively.

In **London** (Administrative County including the City of London) there were 1,105 live births registered corresponding to an annual rate of 13·8 per 1,000 living: stillbirths numbered 35 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,341 (370 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58 against 83, 79 and 71 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 30th January, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·42 ins. at the beginning of the week to 29·04 ins. by 15h. on 24th: increased to 29·42 ins. by 18h. on 26th; decreased to 28·90 ins. by 7h. on 28th; increased to 29·15 ins. by 11h. on 30th; decreased to 29·05 ins. by 18h. on 30th; increased and was 29·14 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 6th FEBRUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the fifth week of the year numbered 6,639 corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 292 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 7,688 (231 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74, against 76, 70 and 72 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 1,100, 1,137, 1,155 and 976 respectively.

In **London** (Administrative County including the City of London) there were 1,325 live births registered corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 39 corresponding to a rate of 29 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,303 (38 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 61 against 79, 71 and 58 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 6th February, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

Sunday ...	31		1·8	9·1	Nearly cloudless till 2h.; nearly overcast till 4h.; nearly cloudless till 10⅔h.; then overcast by 11½h.; Heavy rain 18h. till 19½h.; then rain till 20h.
FEBRUARY.					
Monday ...	1		5·2	9·1	Overcast till 9h.; variably cloudy till 15h.; very cloudy till 16⅔h.; then cloudless.
Tuesday ...	2		0·1	9·2	Cloudless till 2⅔h.; cloudy generally till 7⅓h. then overcast. Rain 7⅔h. till 8¼h. Continuous slight rain 15h. till 21h. Solar halo about 12h. Fresh wind from 17h.
Wednesday ...	3	Discontinued.	0·0	9·3	Overcast generally till 19¾h.; few clouds till 21h.; then overcast. Drizzle 0h. till 1h.; and 4h. till 10h.; with rain 5h. till 6h. Solar halo 12⅔h.; and 15¼h.
Thursday ...	4		0·9	9·3	Overcast generally till 12h.; partially cloudy till 15h.; then overcast. Slight rain at 2h.; 5⅔h.; 12½h. till 12¾h.; 16½h. till 17¼h.; and from 19h. Rain 2¾h. till 4¼h.
Friday ...	5		0·0	9·4	Overcast till 16½h.; cloudy till 18½h.; then nearly overcast generally. Rain till 3¾h.; and frequently from 6½h. till 12h.; then damping till 13⅓h. Fog 5h. till 11h.; then mist till 15h. Fresh wind till 2h.
Saturday ...	6		6·4	9·4	Very cloudy till 1h.; cloudless till 9h.; little cloud till 13h.; partially cloudy till 18h.; cloudless till 23h.; then very cloudy. Mist 6h. till 9h. Hoar frost in morning.
			Sum 14·4	Sum 64·8	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·14 ins. at the beginning of the week to 29·26 ins. by 12h. on January 31st; decreased to 29·08 ins. by 2h. on February 1st; increased to 29·59 ins. by 11h. on February 2nd; decreased generally to 28·89 ins. by 6h. on February 5th; increased and was 29·73 ins. by midnight on the same day.

CENSUS OF ENGLAND AND WALES, 1931

Census volumes in respect of the counties of England and Wales have now been published.

Parts I of the series, which are complete, relate to the areas as constituted at the date of the Census. Parts II will deal with the changes in boundary effected by County schemes under the Local Government Act of 1929, and will provide a limited range of statistics in respect of the newly constituted areas.

Sectional volumes presenting the results of the census of industries, occupations, etc. are also available, and particulars will be furnished on application.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 13th FEBRUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the sixth week of the year numbered 6,479 corresponding to an annual rate of 16·1 per 1,000 living: stillbirths numbered 274 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 6,581 (1,107 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 68, against 70, 72 and 74 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 1,137, 1,155, 976 and 697 respectively.

In **London** (Administrative County including the City of London) there were 1,305 live births registered corresponding to an annual rate of 16·3 per 1,000 living: stillbirths numbered 39 corresponding to a rate of 29 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,151 (152 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62 against 71, 58 and 61 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 13th February, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 13th February, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·73 ins. at the beginning of the week to 28·89 ins. by 10h. on the 8th; increased to 29·77 ins. by 10h. on the 12th; decreased to 29·45 ins. by 4h. on the 13th; increased and was 29·79 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 20th FEBRUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the seventh week of the year numbered 6,375 corresponding to an annual rate of 15·9 per 1,000 living: stillbirths numbered 268 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,971 (610 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 71, against 72, 74 and 68 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 1,155, 976, 697 and 423 respectively.

In **London** (Administrative County including the City of London) there were 1,194 live births registered corresponding to an annual rate of 14·9 per 1,000 living: stillbirths numbered 41 corresponding to a rate of 33 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 972 (179 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58 against 58, 61 and 62 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made f changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from tho published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of t parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in t last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on t 1st April, 1936.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·79 ins. at the beginning of the week to 29·96 ins. by 10½h. on Feb. 15th; decreased to 29·42 ins. by 7h. on Feb. 17th; increased to 29·91 ins. by 7h. on Feb. 18th; decreased to 29·32 ins. by 17h. on Feb. 19th; increased and was 29·63 by midnight of Feb. 20th.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 27th FEBRUARY, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the eighth week of the year numbered 6,228 corresponding to an annual rate of 15·5 per 1,000 living: stillbirths numbered 277 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,384 (587 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 75, against 74, 68 and 71 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 976, 697, 423 and 242 respectively.

In **London** (Administrative County including the City of London) there were 1,175 live births registered corresponding to an annual rate of 14·6 per 1,000 living: stillbirths numbered 44 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,031 (59 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74 against 61, 62 and 58 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for anges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those blished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the rents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the t two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the April, 1936.

Saturday ..	27		2·0	10·8	Little cloud till 5h.; then very cloudy. Overcast 10h. till 21h.; few clouds by 22h. Occasional rain 10h. till 16½h. Squally rain with hail 15½h. till 15¾h. Fresh wind from 10h.
			Sum 11·5	Sum 74·0	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·63 ins. at the beginning of the week to 29·69 ins. by 11h. on Feb. 21st; decreased to 29·13 ins. by 9½h. on Feb. 22nd; increased to 29·55 ins. by 20h. on Feb. 23rd; decreased to 29·16 ins. by 15½h. on Feb. 25th; increased to 29·39 ins. by 1½h. on Feb. 26th; decreased to 28·97 ins. by 16h. on Feb. 26th; increased to 29·07 ins. by 0h. on Feb. 27th; decreased to 28·70 ins. by 16½h on Feb. 27th; increased and was 28·80 ins. by midnight on the same day.

ADVERTISEMENT

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 6th MARCH, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the ninth week of the year numbered 6,514 corresponding to an annual rate of 16·2 per 1,000 living: stillbirths numbered 281 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,440 (56 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 71, against 68, 71 and 75 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 697, 423, 242 and 181 respectively.

In **London** (Administrative County including the City of London) there were 1,294 live births registered corresponding to an annual rate of 16·1 per 1,000 living: stillbirths numbered 42 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,009 (22 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62 against 62, 58 and 74 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 6th March, 1937.

DATE. February, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	28		0·0	10·8	Little cloud till 2h.; becoming overcast by 4h. Snow 9¼h. till 11¼h. Fresh wind 4h. till 9h.; and from 14h.
March					
Monday ...	1		1·2	10·9	Overcast or nearly so. Slight snow 9h. till 10h.
Tuesday ...	2		1·5	11·0	Overcast generally. Nearly cloudless period 8¼h. till 9¼h. Drizzle about 6h. Damping 13¼h. till 15h.; then slight rain or drizzle till 21½h.
Wednesday ...	3	Discontinued.	1·5	11·0	Overcast or nearly so till 16h; little cloud by 16¾h. Cloudless 18h. till 23h.; cloudy by midnight. Slight showers 13¾h. and 15h. Hoar frost at night.
Thursday ...	4		0·3	11·1	Cloudy till 4h.; then overcast, Few clouds from 21¼h.
Friday ...	5		0·0	11·1	Few clouds; overcast from 5h. Continuous rain from 15¾h.; turning to sleet about midnight. Mist in morning.
Saturday ...	6		0·0	11·2	Overcast, except for partially cloudy period 16½h. till 17½h. Sleet till 2¾h. Rain from 23¾h.
			Sum 4·5	Sum 77·1	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 28·80 ins. at the beginning of the week to 28·58 ins. by 11h. on Feb. 28th; increased to 29·44 ins. by 11½h. on March 3rd; decreased to 29·25 ins. by 16h. on March 4th; increased to 29·66 ins. by 11½h. on March 6th; decreased and was 29·47 ins. by midnight on the same day.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 13th MARCH, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the tenth week of the year numbered 6,357 corresponding to an annual rate of 15·8 per 1,000 living: stillbirths numbered 305 corresponding to a rate of 46 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,781 (341 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 76, against 71, 75 and 71 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 423, 242, 181 and 144 respectively.

In **London** (Administrative County including the City of London) there were 1,277 live births registered corresponding to an annual rate of 15·9 per 1,000 living: stillbirths numbered 46 corresponding to a rate of 35 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,115 (106 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62 against 58, 74 and 62 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

Saturday ...	13		4·8	11·7	Very cloudy or nearly overcast till 16¼h.; cloudless by 17½h. Clouding from 21h.; nearly overcast by 22h. Slight showers till 2h. Hoar frost at night.
			Sum 14·0	Sum 80·4	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·47 ins. at the beginning of the week to 29·34 ins. by 5h. on March 7th; increased to 29·54 ins. by 0½h. on March 8th; decreased to 28·85 ins. by 18½h. on March 11th; increased generally to 29·03 ins. by 20½h. on March 13th decreased and was 29·00 ins. by midnight on the same day.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 20th MARCH, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the eleventh week of the year numbered 6,586 corresponding to an annual rate of 16·4 per 1,000 living: stillbirths numbered 281 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,982 (201 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74, against 75, 71 and 76 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 242, 181, 144 and 171 respectively.

In **London** (Administrative County including the City of London) there were 1,269 live births registered corresponding to an annual rate of 15·8 per 1,000 living: stillbirths numbered 51 corresponding to a rate of 39 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,205 (90 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74 against 74, 62 and 62 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

DATE. March, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	14	Discontinued.	0·0	11·7	Overcast throughout. Damping 1h. till 2h.; then continuous rain till 11⅜h.; with hail about 6½h. Becoming foggy with drizzle from 11⅜h. Fog clearing after 13½h.; then occasional slight rain or damping till 19h.
Monday ...	15		7·5	11·8	Overcast till 7h.; then partially cloudy. Clearing from 16½h. to cloudless; with high fog from 18½h. Slight snow 6½h. till 7h. Hoar frost at night.
Tuesday ...	16		0·1	11·9	Cloudless till 7h.; overcast by 8h. Slight rain 13h. till 15½h.; then rain till 20½h. Rain 21h. till 21½h.; then nearly overcast. Hoar frost in morning.
Wednesday ...	17		2·3	11·9	Very cloudy or nearly overcast. Occasional rain 5h. till 9h.; and 14h. till 21½h.
Thursday ...	18		5·1	12·0	Nearly overcast till 13½h.; cloudy till 17h.; then nearly cloudless. Showers at 2h., about 9h.; and at 10h. Dew at night.
Friday ...	19		3·2	12·1	Little cloud till 9h.; nearly overcast by 10h. Partially cloudy from 16½h. till 19½h.; then nearly cloudless. Showery rain 12h. till 15¼h. Dew at night.
Saturday ...	20		8·0	12·1	Nearly cloudless till 10h.; then partially cloudy. Nearly overcast from 15h. Mist in early morning.
			Sum 26·2	Sum 83·5	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·01 ins. at the beginning of the week to 28·67 ins. by 10h. on March 14th; increased to 29·94 ins. by 1h. on March 16th; decreased to 29·36 ins. by 5h. on March 18th; increased generally and was 29·43 ins. by midnight on March 20th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 27th MARCH, 1937

BIRTHS AND DEATHS.

In the 122 **County Boroughs and Great Towns** of England and Wales the live births registered in the twelfth week of the year numbered 5,728 corresponding to an annual rate of 14·3 per 1,000 living: stillbirths numbered 259 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,531 (451 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 72, against 71, 76 and 74 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 181, 144, 171 and 98 respectively.

In **London** (Administrative County including the City of London) there were 1,071 live births registered corresponding to an annual rate of 13·3 per 1,000 living: stillbirths numbered 40 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,051 (154 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52 against 62, 62 and 74 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 122 Towns, but the comparable totals for 1936 and 1937 in the last two columns, are in respect of 121 Towns only. They do not include figures for Thurrock U.D., which was created on the 1st April, 1936.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·43 ins. at the beginning of the week to 29·85 ins. by 9½h. on March 24th; decreased to 29·49 ins. by 3½h. on March 26th; increased and was 29·82 ins. by midnight on March 27th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 3rd APRIL, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirteenth week of the year numbered 6,126 corresponding to an annual rate of 15·2 per 1,000 living: stillbirths numbered 274 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,517 (14 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 76, against 76, 74 and 72 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 144, 171, 98 and 101 respectively.

In **London** (Administrative County including the City of London) there were 1,150 live births registered corresponding to an annual rate of 14·3 per 1,000 living: stillbirths numbered 38 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,107 (56 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 61 against 62, 74 and 52 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 3rd April, 1937.

DATE. March, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	28		4·4	12·7	Little cloud till 8½h., then very cloudy. Partially cloudy 14½h. till 17½h., cloudless by 18h. Cloudy from 23h. Hoar frost in morning and at night.
Monday ...	29		2·9	12·7	Cloudy, overcast from 3h. Few clouds from 7h. till 10h., nearly overcast by 11h. Partially cloudy from 22h. Mist in morning.
Tuesday ...	30		0·0	12·8	Little cloud till 1h.; nearly overcast or overcast from 1½h.
Wednesday ...	31	Discontinued.	8·8	12·8	Nearly overcast till 7h., few clouds till 11h., then thin cloud. Cloudless from 19h. Solar halo 11½h. till 15½h. Hoar frost at night.
April.					
Thursday ...	1		2·2	12·9	Cloudless till 3h.; then thick fog. Clearing from 9h.; cloudless by 10h. Very cloudy 12h. till 16h., then overcast. Hoar frost in morning. High fog from 18h.
Friday ...	2		0·0	13·0	Overcast generally. Slight rain 5½h. till 7h., then rain till 11½h. Rain 18h. till 23h., then slight rain. Misty during day.
Saturday ...	3		7·7	13·0	Rain ceased by 0½h., then generally cloudy. Cloudless or nearly so from 16½h. Dew and mist at night.
			Sum 26·0	Sum 89·9	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·82 ins. at the beginning of the week to 30·21 ins. by 9h. on March 30th; decreased to 29·15 ins. by 16½h. on April 2nd; increased and was 29·48 ins. by midnight on April 3rd.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 10th APRIL, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the fourteenth week of the year numbered 7,422 corresponding to an annual rate of 18·4 per 1,000 living: stillbirths numbered 258 corresponding to a rate of 34 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,697 (180 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 85, against 74, 72 and 76 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 171, 98, 101 and 112 respectively.

In **London** (Administrative County including the City of London) there were 1,383 live births registered corresponding to an annual rate of 17·2 per 1,000 living: stillbirths numbered 38 corresponding to a rate of 27 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,116 (9 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62 against 74, 52 and 61 in the preceding three weeks.

Enteric (including Paratyphoid) fever.	21	29	72	1	—	?

The numbers of " expected " notifications shown in the above table are based on the Median Value of the corresponding weeks of 1928–36.

England and Wales

Death Rates from Tuberculosis and Cancer, and Maternal Mortality—1936

Provisional death-rates per million population for England and Wales during the year 1936 are as follows :—

	Males	*Females*	*Persons*
Respiratory Tuberculosis	703	472	583
Other Tuberculosis	122	97	109
Cancer	1,612	1,636	1,625

The maternal mortality (provisional) based on deaths primarily classed to puerperal conditions is as follows :—

Puerperal Sepsis per 1,000 Live Births 1·40, per 1,000 Total Births 1·34.
Other accidents and diseases of pregnancy and parturition per 1,000 Live Births 2·41, per 1,000 Total Births 2·31.

Table 1.—123 County Boroughs and Great Towns, Greater London, and Four Scottish and Irish Towns.

BIRTHS and DEATHS registered in the week ended 10th April, 1937.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·48 ins. at the beginning of the week to 29·83 ins. by 23h. on April 6th; decreased to 29·63 ins. by 16h. on April 7th; increased to 29·81 ins. by 21h. on April 8th; decreased to 29·18 ins. by 17½h. on April 10th; increased and was 29·23 ins. by midnight on the same day.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified in characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 17th APRIL, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the fifteenth week of the year numbered 6,898 corresponding to an annual rate of 17·1 per 1,000 living: stillbirths numbered 299 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,949 (748 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 67, against 72, 76 and 85 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 98, 101, 112 and 73 respectively.

In **London** (Administrative County including the City of London) there were 1,325 live births registered corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 46 corresponding to a rate of 34 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 925 (191 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62 against 52, 61 and 62 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 17th April, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 17th April, 1937.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·23 ins. at the beginning of the week to 29·54 ins. by 21⅛h. on April 12th; decreased to 29·19 ins. by 4¼h. on April 14th; increased to 29·61 ins. by 12¼h. on April 15th; decreased to 29·17 ins. by 12⅜h. on April 16th; increased and was 29·63 ins. by midnight on April 17th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 24th APRIL, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the sixteenth week of the year numbered 6,861 corresponding to an annual rate of 17·0 per 1,000 living: stillbirths numbered 291 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,679 (270 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 63, against 76, 85 and 67 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 101, 112, 73 and 47 respectively.

In **London** (Administrative County including the City of London) there were 1,358 live births registered corresponding to an annual rate of 16·9 per 1,000 living: stillbirths numbered 53 corresponding to a rate of 38 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 933 (8 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 57 against 61, 62 and 62 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

			Sum 24·0	Sum 99·4	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea ; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·63 ins. at the beginning of the week to 29·72 ins. by 10h. on April 19th; decreased to 29·08 ins. by 17h. on April 20th; increased to 29·88 ins. by 22h. on April 21st; decreased to 29·78 ins. by 5h. on April 22nd; increased to 30·03 ins. by 10h. on April 24th; decreased and was 29·96 ins. by midnight on the same day.

ADVERTISEMENT

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 1st MAY, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the seventeenth week of the year numbered 6,598 corresponding to an annual rate of 16·4 per 1,000 living: stillbirths numbered 284 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,499 (180 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 62, against 85, 67 and 63 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 112, 73, 47 and 33 respectively.

In **London** (Administrative County including the City of London) there were 1,240 live births registered corresponding to an annual rate of 15·4 per 1,000 living: stillbirths numbered 46 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 921 (12 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 66 against 62, 62 and 57 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 1st May, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·96 ins. at the beginning of the week to 29·88 ins. by 2h. on April 28th; increased to 30·28 ins. by 10h. on April 30th; decreased and was 30·08 ins. by midnight of May 1st.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 8th MAY, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the eighteenth week of the year numbered 6,870 corresponding to an annual rate of 17·0 per 1,000 living: stillbirths numbered 291 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,692 (193 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 65, against 67, 63 and 62 in the preceding three weeks.

During the last four weeks deaths from influenza numbered 73, 47, 33 and 31 respectively.

In **London** (Administrative County including the City of London) there were 1,308 live births registered corresponding to an annual rate of 16·3 per 1,000 living: stillbirths numbered 38 corresponding to a rate of 28 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 922 (1 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58 against 62, 57 and 66 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for hanges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that late to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to he end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30·08 ins. at the beginning of the week to 29·64 ins. by 17h. on May 3rd; increased to 30·14 ins. by 9h. on May 6th; decreased and was 29·86 ins. by midnight of May 8th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 15th MAY, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the nineteenth week of the year numbered 6,133 corresponding to an annual rate of 15·2 per 1,000 living: stillbirths numbered 277 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,537 (155 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 61, against 63, 62 and 65 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,188 live births registered corresponding to an annual rate of 14·8 per 1,000 living: stillbirths numbered 51 corresponding to a rate of 41 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 884 (38 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48 against 57, 66 and 58 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea ; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·86 ins. at the beginning of the week to 29·50 ins. by 11h. on May 11th ; increased generally and was 29·88 ins. by midnight on May 15th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 22nd MAY, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the twentieth week of the year numbered 6,635 corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 275 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,437 (100 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the ast 52 weeks, was 61, against 62, 65 and 61 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,326 live births registered corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 43 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 856 (28 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 57 against 66, 58 and 48 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for anges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that ate to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to ie end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 22nd May, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·88 ins. at the beginning of the week to 29·91 ins. by 9h. on May 16th; decreased to 29·29 ins. by 5h. on May 21st; increased and was 29·92 ins. by midnight on May 22nd.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 29th MAY, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-first week of the year numbered 7,585 corresponding to an annual rate of 18·8 per 1,000 living: stillbirths numbered 307 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,545 (108 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58, against 65, 61 and 61 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,353 live births registered corresponding to an annual rate of 16·9 per 1,000 living: stillbirths numbered 41 corresponding to a rate of 29 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 844 (12 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 44 against 58, 48 and 57 in the preceding three weeks.

NZA—Deaths	181	144	171	98	101	112	73	47	33	31	36	34	22	1,640	7,578

The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for ges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those shed for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the ts.

The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to nd of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·92 ins. at the beginning of the week to 29·99 ins. by 10h. on May 23rd; decreased to 29·86 ins. by 4h on May 24th; increased to 29·94 ins. by 22h. on May 24th; decreased to 29·81 ins. by 15h. on May 26; increased to 30·19 ins. by 0h. on May 28; decreased and was 30·01 in. by midnight on May 29.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 5th JUNE, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-second week of the year numbered 7,275 corresponding to an annual rate of 18·0 per 1,000 living: stillbirths numbered 313 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,188 (357 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 61, 61 and 58 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,410 live births registered corresponding to an annual rate of 17·8 per 1,000 living: stillbirths numbered 52 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 800 (44 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 46 against 48, 57 and 44 in the preceding three weeks.

The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for nges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those olished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the ents.

The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that e to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to end of March and 122 Towns thereafter.

The results apply to the Civil Day, or rom midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30·01 ins. at the beginning of the week to 29·86 ins. by 18h. on May 31., increased to 30·00 in. by 11h. on June 2nd; decreased to 29·84 ins. by 4h. on June 4th; increased to 29·92 ins. by 10h. on June 5th; decreased and was 29·89 in. by midnight on the same day.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 12th JUNE, 1937

BIRTHS AND DEATHS.

In the 123 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-third week of the year numbered 7,101 corresponding to an annual rate of 17·6 per 1,000 living: stillbirths numbered 281 corresponding to a rate of 38 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,097 (91 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 49, against 61, 58 and 50 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,337 live births registered corresponding to an annual rate of 16·8 per 1,000 living: stillbirths numbered 43 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 807 (7 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 41 against 57, 44 and 46 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 12th June, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for ges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those shed for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the ths.

The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that to 123 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to nd of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·89 ins. at the beginning of the week to 29·76 ins. by 16h. on June 7th; increased to 29·88 ins. by 14h. on June 8th; decreased to 29·66 ins. by 18h. on June 10th; increased and was 30·00 in. by midnight on June 12th.

INFLUENZA

After the severe outbreak of influenza in 1918-19 a comprehensive Report surveying the main characteristics of the disease in different parts of the world was published by the Ministry of Health.

It was divided into the following chapters :—

The History of Influenza in England, 1658-1911.

A General Statistical Study of the Influenzas of 1918-19 in the United Kingdom.

Clinical Features of the Epidemics of 1918-19 (by Dr. Herbert French).

The Bacteriology of the Influenzas of 1918-19 (by Sir Frederick Andrewes).

The Infectivity of Influenza.

Natural Immunity and the Protection conferred by a previous Attack of Influenza.

The relation between Meteorological Conditions and the Death Rate from Respiratory Diseases with particular reference to Influenza.

Domestic Overcrowding and Influenza.

The General and Special Prophylaxis of Influenza.

A General Discussion of the Epidemiology of Influenza.

Apart from the extremely interesting historical information by which the Report is prefaced it will be of permanent value for its careful and exhaustive survey of the most serious outbreak of influenza known in recent medical history.

Price 10s. net. Post free 10s. 6d.

"The issue of the Report has been called timely, and this leads us to hope that all who are officially concerned in erecting and maintaining our defences against epidemic disease, will study the terrible story of 1918-19 in the light of future and organised activities that may be demanded of them."

The Lancet, 5th February, 1921.

"We believe that Sir George Newman was justified n characterising this Report as a contribution of exceptional interest and suggestiveness."

British Medical Journal, 5th March, 1921.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 19th JUNE, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-fourth week of the year numbered 7,165 corresponding to an annual rate of 17·7 per 1,000 living: stillbirths numbered 310 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,768 (329 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 58, 50 and 49 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,336 live births registered corresponding to an annual rate of 16·8 per 1,000 living: stillbirths numbered 46 corresponding to a rate of 33 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 724 (83 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 37 against 44, 46 and 41 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns up to the 31st March relate to 122 Towns, but subsequent to that date to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30·00 ins. at the beginning of the week to 30·19 ins. by 22h. on June 15th; decreased to 29·73 ins. by 5h. on June 19th; increased and was 29·79 in. by midnight on the same day.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 26th JUNE, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-fifth week of the year numbered 6,902 corresponding to an annual rate of 17·1 per 1,000 living: stillbirths numbered 296 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,905 (137 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 47, against 50, 49 and 50 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,294 live births registered corresponding to an annual rate of 16·3 per 1,000 living: stillbirths numbered 45 corresponding to a rate of 34 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 752 (28 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 42 against 46, 41 and 37 in the preceding three weeks.

CORRIGENDUM.

REGISTRAR GENERAL'S WEEKLY RETURN No. 24.

Week ended 19th June, 1937.

Page 622. Table 3. Summary. Administrative areas other than London.

Notifications of Diphtheria should read :—897.

(43717)

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 26th June, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·79 ins. at the beginning of the week to 29·94 ins. by 11h. on June 21st; decreased to 29·76 ins. by 17h. on June 22nd; increased to 29·97 ins. by 9h. on June 26th; decreased and was 29·94 ins. by midnight on the same day.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 3rd JULY, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-sixth week of the year numbered 6,665 corresponding to an annual rate of 16·5 per 1,000 living: stillbirths numbered 300 corresponding to a rate of 43 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,986 (81 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 49, against 49, 50 and 47 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,324 live births registered corresponding to an annual rate of 16·7 per 1,000 living: stillbirths numbered 50 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 732 (20 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 36 against 41, 37 and 42 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 3rd July, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 3rd July, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·94 ins. at the beginning of the week to 29·57 ins. by 3h. on June 29th; increased to 29·95 ins. by 7h. on July 2nd; decreased to 29·68 ins. by 20h. on July 3rd; increased and was 29·72 ins. by midnight on the same day.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 10th JULY, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-seventh week of the year numbered 6,800 corresponding to an annual rate of 16·8 per 1,000 living: stillbirths numbered 269 corresponding to a rate of 38 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,796 (190 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48, against 50, 47 and 49 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,225 live births registered corresponding to an annual rate of 15·4 per 1,000 living: stillbirths numbered 47 corresponding to a rate of 37 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 748 (16 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 45 against 37, 42 and 36 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·72 ins. at the beginning of the week to 30·01 ins. by 7h. on July 5th; decreased to 29·72 ins. by 4h. on July 7th; increased to 29·99 ins. by 11h. on July 8th; decreased to 29·71 ins. by 20h. on July 9th; increased and was 29·91 ins. by midnight on July 10th.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 17th JULY, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-eighth week of the year numbered 6,780 corresponding to an annual rate of 16·8 per 1,000 living: stillbirths numbered 293 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,747 (49 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 47, 49 and 48 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,244 live births registered corresponding to an annual rate of 15·7 per 1,000 living: stillbirths numbered 41 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 705 (43 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48 against 42, 36 and 45 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·91 ins. at the beginning of the week to 29·93 ins. by 8h. on July 11th; decreased generally to 29·44 ins. by 15h. on July 15th; increased and was 30·09 ins. by midnight on July 17th.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 24th JULY, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the twenty-ninth week of the year numbered 6,627 corresponding to an annual rate of 16·4 per 1,000 living: stillbirths numbered 276 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,604 (143 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43, against 49, 48 and 50 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,289 live births registered corresponding to an annual rate of 16·2 per 1,000 living: stillbirths numbered 56 corresponding to a rate of 42 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 713 (8 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 40 against 36, 45 and 48 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 24th July, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 24th July, 1937.

DATE July, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	18	Discontinued.	1·5	16·1	Nearly overcast till 19½h., clearing to nearly cloudless by 20¼h.
Monday ...	19		1·1	16·1	Cloudless till 1h., nearly overcast by 3h. Slight rain 14h. till 15h. and about 19½h. Solar halo 15h. Distant thunder 18h. till 21h., with lightning from 20h.
Tuesday ...	20		6·3	16·0	Overcast till 5h., cloudless by 6½h. Partially cloudy 10h. till 16h. then nearly overcast. Slight haze during day.
Wednesday ...	21		2·0	16·0	Nearly overcast or overcast till 19h., cloudless by 20h. Nearly overcast again from 21½h. Slight rain 13¾h. till 16h.
Thursday ...	22		4·3	15·9	Nearly overcast, except for a period of little cloud 4h. till 7h.
Friday ...	23		2·6	15·9	Nearly overcast or overcast. Partially cloudy period 15½h. till 17h. Drizzle 5¼h. till 9h. and at 10½h.
Saturday ...	24		9·0	15·8	Overcast till 3h., clearing to few clouds by 4h. Very cloudy from 9½h. till 17½h., then overcast.
			Sum 26·8	Sum 111·8	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30·09 ins. at the beginning of the week to 29·63 ins. by 20h. on July 21st; increased to 29·71 ins. by 22h. on July 22nd; decreased to 29·50 ins. by 18h. on July 23rd; increased and was 29·64 ins. by midnight on July 24th.

ASSURANCE COMPANIES RETURNS, 1936.

Statements of Assurance business under the Assurance Companies Act, 1909, deposited with the Board of Trade during the year ended December 31, 1936.

The information relating to the Life and Bond Investment business of Companies transacting those classes of business renders possible a comparative study of the varied experience of Companies during the period covered. Valuation Returns, Revenue Accounts and Balance Sheets are given separately, the two latter being shown also in summary form. Additional summaries covering Life Assurances in Force, Bond Investment Policies in Force and New Life Assurance business effected during the period are shown together with comparative statements of Life Assurance and Bond Investment business during the past 10 years.

Summaries of Revenue Accounts, Profit and Loss Accounts (including those of Life and Bond Investment Companies), Balance Sheets of Companies transacting the other classes of business to which the Assurance Companies Act, 1909, as amended by the Road Traffic Acts, 1930 to 1934, relates, and Personal Accident and Employers' Liability insurance claims paid and outstanding together with miscellaneous information, are also contained in the volume.

Taken as a whole the work constitutes an authoritative and indispensable record of assurance business. The publication is issued annually and a standing order may be given for its regular supply.

EXPLANATORY STATEMENT

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 31st JULY, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirtieth week of the year numbered 7,085 corresponding to an annual rate of 17·5 per 1,000 living: stillbirths numbered 288 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,727 (123 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 48, 50 and 43 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,220 live births registered corresponding to an annual rate of 15·4 per 1,000 living: stillbirths numbered 53 corresponding to a rate of 42 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 685 (28 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 49 against 45, 48 and 40 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 31st July, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·64 ins. at the beginning of the week to 29·92 ins. by 12h. on July 27th; decreased to 29·80 ins. by 17h. on July 29th; increased and was 29·97 ins. by midnight of July 31st.

1937 No. 31

THE REGISTRAR-GENERAL'S WEEKLY RETURN OF

BIRTHS AND DEATHS

REGISTERED IN
COUNTY BOROUGHS AND OTHER GREAT TOWNS
AND OF CASES OF CERTAIN SPECIFIED

INFECTIOUS DISEASES

NOTIFIED IN BOROUGHS, URBAN AND RURAL
DISTRICTS AND PORT SANITARY DISTRICTS
IN ENGLAND AND WALES DURING
THE WEEK ENDED

SATURDAY, 7th AUGUST, 1937

EXPLANATORY STATEMENT

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 7th AUGUST, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-first week of the year numbered 5,895 corresponding to an annual rate of 14·6 per 1,000 living: stillbirths numbered 236 corresponding to a rate of 38 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,743 (16 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48, against 50, 43 and 50 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,112 live births registered corresponding to an annual rate of 14·0 per 1,000 living: stillbirths numbered 36 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 684 (1 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48 against 48, 40 and 49 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 7th August, 1937.

Sunday ...	1	Discontinued.	8·1	15·4	Little cloud, becoming overcast by 1h. Clearing 10h. to nearly cloudless by 11h.
Monday ...	2		7·1	15·4	Nearly cloudless ; overcast from 3h. till 10½h. ; then partially cloudy. Little cloud from 17h.
Tuesday ...	3		5·1	15·3	Little cloud. Overcast and misty from 3h. Clearing from 8h. ; nearly cloudless, slight haze from 9h.
Wednesday ...	4		4·7	15 3	Nearly cloudless till 12h. ; overcast by 13½h. Shower about 15h. Rain, heavy at first, 16h. 25m. till 17h. ; with occasional thunder and lightning.
Thursday ...	5		4·9	15·2	Overcast or nearly so till 14h. ; then cloudy. Cloudless from 19½h.
Friday ...	6		12·3	15·2	Little cloud ; partially cloudy period 13h. till 15h.
Saturday ...	7		12·3	15·1	Little cloud ; partially cloudy period 3h. till 6h. Slight haze generally.
			Sum 54·5	Sum 106·9	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea ; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·97 ins. at the beginning of the week to 30·07 ins. by 9h. on Aug. 2nd ; decreased to 29·78 ins. by 3h. on Aug. 7th ; increased and was 29·86 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 14th AUGUST, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-second week of the year numbered 7,006 corresponding to an annual rate of 17·3 per 1,000 living: stillbirths numbered 241 corresponding to a rate of 33 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,627 (116 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43, against 43, 50 and 48 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,235 live births registered corresponding to an annual rate of 15·6 per 1,000 living: stillbirths numbered 42 corresponding to a rate of 33 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 711 (27 more than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 38 against 40, 49 and 48 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for anges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·86 ins. at the beginning of the week to 29·99 ins. by 8h. on Aug. 9th; decreased to 29·56 ins. by 13h. on Aug. 14th; increased and was 29·67 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE 1 shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 21st AUGUST, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-third week of the year numbered 7,045 corresponding to an annual rate of 17·4 per 1,000 living: stillbirths numbered 257 corresponding to a rate of 35 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,433 (194 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 41, against 50, 48 and 43 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,366 live births registered corresponding to an annual rate of 17·2 per 1,000 living: stillbirths numbered 31 corresponding to a rate of 22 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 661 (50 less than the number in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43 against 49, 48 and 38 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made fo changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from thos published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of th parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 an 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·67 ins. at the beginning of the week to 29·73 ins. by 1h. on Aug. 16th; decreased to 29·45 ins. by 2h. on Aug. 17th; increased to 30·01 ins. by 0h. on Aug. 20th; decreased to 29·89 ins. by 14h. on Aug 21st; increased and was 29·94 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 28th AUGUST, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-fourth week of the year numbered 6,628 corresponding to an annual rate of 16·4 per 1,000 living: stillbirths numbered 268 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,579 (146 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 43, against 48, 43 and 41 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,178 live births registered corresponding to an annual rate of 14·8 per 1,000 living: stillbirths numbered 44 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 661 (the same number as in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 34 against 48, 38 and 43 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 28th August, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

DATE		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
AUGUST, 1937					
Sunday ...	22		7·6	14·8	Few clouds, becoming overcast by 1h. Gradually clearing from 11h. to few clouds by 11¾h. Few clouds till 18½h.; then cloudless or nearly so.
Monday ...	23		7·5	14·2	Cloudless or nearly so. A period of few clouds 10½h. till 17h. Dew in morning and slight haze during day. Slight mist at night.
Tuesday ...	24		7·3	14·1	Nearly cloudless till 11½h. Cloudy till 16h.; then few clouds. Nearly overcast from 23h.
Wednesday ...	25	Discontinued.	1·0	14·0	Nearly overcast generally. Lunar halo at 3¼h. Dew and mist in morning.
Thursday ...	26		0·1	14·0	Overcast or nearly so. Dew and mist in morning.
Friday ...	27		0·2	13·9	Overcast till 15h.; then nearly overcast generally.
Saturday ...	28		1·1	13·9	Overcast generally till 16h., clearing to nearly cloudless by 17h.
			Sum 24·8	Sum 98·4	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·94 ins. at the beginning of the week to 30·01 ins. by 8h. on Aug. 23rd; decreased to 29·93 ins. by 16h. on Aug. 24th; increased to 30·17 ins. by 23h. on Aug. 26th; decreased and was 29·98 ins. by midnight on Aug. 28th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 4th SEPTEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-fifth week of the year numbered 6,463 corresponding to an annual rate of 16·0 per 1,000 living: stillbirths numbered 267 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,603 (24 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 44, against 43, 41 and 43 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,182 live births registered corresponding to an annual rate of 14·9 per 1,000 living: stillbirths numbered 37 corresponding to a rate of 30 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 691 (30 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 35 against 38, 43 and 34 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for hanges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

ble 5.—Meteorology in certain Towns during the Week ended Saturday, 4th September, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·98 ins. at the beginning of the week to 29·74 ins. by 17h. on Sept. 1st; increased to 30·10 ins. by 9h. on Sept. 4th; decreased and was 30·05 ins. by midnight on Saturday.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 11th SEPTEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-sixth week of the year numbered 6,353 corresponding to an annual rate of 15·7 per 1,000 living: stillbirths numbered 269 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,602 (1 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 47, against 41, 43 and 44 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,168 live births registered corresponding to an annual rate of 14·7 per 1,000 living: stillbirths numbered 39 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 674 (17 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 35 against 43, 34 and 35 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 30·05 ins. at the beginning of the week to 29·86 ins. by 17h. on Sept. 6th; increased to 30·13 ins. by 22h. on Sept. 8th; decreased to 29·86 by 0h. on Sept. 10th; increased to 29·98 ins. by 22h. on Sept. 10th; decreased generally and was 29·97 ins. by midnight on Sept. 11th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 18th SEPTEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-seventh week of the year numbered 6,318 corresponding to an annual rate of 15·6 per 1,000 living: stillbirths numbered 253 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,753 (151 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 47, against 43, 44 and 47 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,217 live births registered corresponding to an annual rate of 15·3 per 1,000 living: stillbirths numbered 40 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 707 (33 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 32 against 34, 35 and 35 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for anges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·97 ins. at the beginning of the week to 28·99 ins. by 17h. on Sept. 17th; increased and was 29·34 ins. by midnight on Sept. 18th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 25th SEPTEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-eighth week of the year numbered 6,460 corresponding to an annual rate of 16·0 per 1,000 living: stillbirths numbered 214 corresponding to a rate of 32 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,906 (151 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 44, 47 and 47 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,264 live births registered corresponding to an annual rate of 15·9 per 1,000 living: stillbirths numbered 42 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 762 (55 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 38 against 35, 35 and 32 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 25th September, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 25th September, 1937.

(Supplied by the Meteorological Office.)

DATE. SEPTEMBER, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	19	Discontinued.	0·0	12·4	Few clouds till 2h., overcast by 4h. Cloudy generally from 19h. Occasional slight drizzle 7h. till 18h., with heavy rain 13¾h. till 14h.
Monday ...	20		1·9	12·4	Very cloudy till 15½h.; then overcast. Cloudless from 18¼h. Rain, heavy at first 15½h. till 16¼h.
Tuesday ...	21		1·8	12·3	Cloudless till 6h., then thin cloud. Nearly overcast from 10h. Mist and hoar frost in morning.
Wednesday ...	22		4·5	12·3	Nearly overcast till 9h.; cloudy till 16h., then little cloud. Lunar halo 20h. till 21¼h.
Thursday ...	23		8·0	12·2	Cloudless till 9h.; few clouds till 12h.; becoming very cloudy by 14½h. Clearing 17h. to cloudless by 18h. Dew in morning and night.
Friday ...	24		8·0	12·1	Nearly cloudless till 12½h.; overcast by 16h. Dew in morning. Drizzle from 23h.
Saturday ...	25		0·0	12·1	Overcast throughout. Frequent drizzle till 20h., then damping.
			Sum 24·2	Sum 85·8	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·34 ins. at the beginning of the week to 29·86 ins. by 9h. on Sept. 21st; decreased to 29·73 ins. by 4h. on Sept. 22nd; increased to 30·03 ins. by 0h. on Sept. 24th; decreased to 29·90 ins. by 4h. on Sept. 25th; increased to 29·97 ins. by 11h. on Sept. 25th; decreased and was 29·94 ins. by midnight on the same day

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 2nd OCTOBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the thirty-ninth week of the year numbered 6,320 corresponding to an annual rate of 15·6 per 1,000 living: stillbirths numbered 259 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,006 (100 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 48, against 47, 47 and 52 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,199 live births registered corresponding to an annual rate of 15·1 per 1,000 living: stillbirths numbered 34 corresponding to a rate of 28 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 765 (3 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 32 against 35, 32 and 38 in the preceding three weeks.

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

DATE.		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
SEPTEMBER, 1937					
Sunday ...	26		10·0	12·0	Nearly overcast till 6h.; partially cloudy till 13h.; few clouds till 17h.; then cloudless. Damping till 2¼h.; rain about 1¼h.
Monday ...	27		0·5	11·9	Cloudless till 6h.; becoming nearly overcast by 8h. Overcast from 18h. Heavy dew and mist in morning. Slight rain 10¾h. till 14½h. and rain from 20¾h. till 21¼h.
Tuesday ...	28		6·0	11·9	Overcast till 4h.; then very cloudy. Partially cloudy 12h. till 17h.; then nearly cloudless. Thin cloud from 21h.
Wednesday ...	29	Discontinued.	6·2	11·8	Thin cloud till 7h.; cloudy till 16h.; clearing to cloudless by 16½h. Dew and fog in morning.
Thursday ...	30		6·9	11·7	Cloudless till 1h.; very cloudy by 18¾h. Partially cloudy generally from 9h. Dew and fog in morning.
OCTOBER Friday ...	1		5·1	11·7	Little cloud till 6h.; cloudy, mainly thin cloud till 16h., then few clouds. Dew in morning and at night.
Saturday ...	2		3·3	11·6	Thin cloud till 5h., then overcast and foggy. Clearing from 9h., few clouds by 10h. Overcast from 16h. Dew in morning, mist at night.
			Sum 38·0	Sum 82·6	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·95 ins. at the beginning of the week to 29·77 ins. by 2h. on the 28th; increased to 30·05 ins. by 9h. on the 29th; decreased to 29·69 ins. by 16h. on 1st Oct.; increased and was 29·82 ins. by midnight on 2nd Oct.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 9th OCTOBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the fortieth week of the year numbered 6,445 corresponding to an annual rate of 15·9 per 1,000 living: stillbirths numbered 277 corresponding to a rate of 41 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 3,910 (99 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 50, against 47, 52 and 49 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,242 live births registered corresponding to an annual rate of 15·6 per 1,000 living: stillbirths numbered 42 corresponding to a rate of 33 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 756 (9 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 36 against 32, 38 and 32 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 9th October, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polioencephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 9th October, 1937.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·82 ins. at the beginning of the week to 30·35 ins. by 21h. on Oct. 4th; decreased to 29·75 ins. by 2h. on Oct. 8th; increased and was 30·30 ins. by midnight on Oct. 9th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 16th OCTOBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-first week of the year numbered 6,337 corresponding to an annual rate of 15·7 per 1,000 living: stillbirths numbered 245 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,024 (114 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 51, against 52, 49 and 50 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,199 live births registered corresponding to an annual rate of 15·1 per 1,000 living: stillbirths numbered 49 corresponding to a rate of 39 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 771 (15 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 39 against 38, 32 and 36 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 16th October, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for hanges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the arents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30·30 ins. at the beginning of the week to 30·31 ins. by 9h. on Oct. 10th; decreased to 30·06 ins. by 5h. on Oct. 12th; increased to 30·16 ins. by 9h. on Oct. 13th; decreased to 29·99 ins. by 7h. on Oct. 14th; increased and was 30·33 ins. by midnight on Oct. 16th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 23rd OCTOBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-second week of the year numbered 5,984 corresponding to an annual rate of 14·8 per 1,000 living: stillbirths numbered 248 corresponding to a rate of 40 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,319 (295 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 56, against 49, 50 and 51 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,120 live births registered corresponding to an annual rate of 14·1 per 1,000 living: stillbirths numbered 30 corresponding to a rate of 26 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 879 (108 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 38 against 32, 36 and 39 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 23rd October, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for nges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those lished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the ents.

The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 7 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

DATE. October, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	17		4·0	10·6	Nearly overcast till 12h.; clearing to nearly cloudless by 13½h. Mist after 12h.; fog from 18h.; clearing at 21½h.
Monday ...	18		0·5	10·6	Nearly cloudless till 4h.; then thick wet fog; less dense between 10h. and 17h. Hoar frost in early morning.
Tuesday ...	19		4·0	10·5	Thick wet fog till 8h.; clearing by 10½h; then little cloud. Misty from 18h.; thickening after 21h.
Wednesday ...	20	Discontinued.	(Registration failed)		Thick wet fog till 8h.; then clearing to little cloud by 10h. Mist and hoar frost at night.
Thursday ...	21		4·7	10·4	Cloudless; thick wet fog by 0½h. Clearing 10h. to cloudless; moderate fog by 11h. Fog rapidly clearing at 14h. Dew at night.
Friday ...	22		3·6	10·3	Few clouds till 6h.; then cloudy. Overcast from 14h. Occasional slight rain 15h. till 17h; then rain till 21h.
Saturday ...	23		2·2	10·2	Overcast till 11h.; then variably cloudy. Overcast generally from 15h. Occasional rain, heavy at times 2h. till 21h.; nearly continuous rain and heavy rain between 16h. and 19h.
			Sum 19·0	Sum 62·6	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30·33 ins. at the beginning of the week to 30·38 ins. by 7½h. on the 17th; decreased to 28·50 ins. by 19h. on the 23rd; increased and was 28·57 ins. by midnight on the 23rd.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 30th OCTOBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-third week of the year numbered 6,406 corresponding to an annual rate of 15·8 per 1,000 living: stillbirths numbered 260 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,330 (11 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 51, against 50, 51 and 56 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,264 live births registered corresponding to an annual rate of 15·9 per 1,000 living: stillbirths numbered 41 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 857 (22 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 32 against 36, 39 and 38 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 30th October, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (see note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 30th October, 1937.

(Supplied by the Meteorological Office.)

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 28·57 ins. at the beginning of the week to 29·11 ins. by 18h. on Oct. 24th; decreased to 28·85 ins. by 14h. on Oct. 25th; increased to 29·53 ins. by 8h. on Oct. 27th; decreased to 29·44 ins. by 15h. on Oct. 27th; increased to 29·60 ins. by 19h. on Oct. 28th; decreased to 29·19 ins. by 3h. on Oct. 30th; increased and was 29·61 ins. by midnight on the same day.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 6th NOVEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-fourth week of the year numbered 6,474 corresponding to an annual rate of 16·0 per 1,000 living: stillbirths numbered 287 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,455 (125 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 52, against 51, 56 and 51 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,134 live births registered corresponding to an annual rate of 14·3 per 1,000 living: stillbirths numbered 49 corresponding to a rate of 41 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 867 (10 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 34 against 39, 38 and 32 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 6th November, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever	Acute pneumonia (prim'y or influenz'l)	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for anges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ublished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the rents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and 37 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Sunday ...	31		1·2	9·8	Generally cloudy till 16h., then overcast. Rain 18h. till 19¾h., and heavy rain about 21h.
November Monday ...	1		0·0	9·7	Overcast till 20½h., then variably cloudy. Continuous rain, heavy at times, 10h. till 16¼h. Misty 5h. till 16h.
Tuesday ...	2		0·0	9·6	Nearly cloudless till 3h., then thick wet fog; thinner after 18h.
Wednesday ...	3	Discontinued.	0·0	9·6	Foggy till 14h., then overcast and misty. Clearing 18h. to cloudless by 18¾h. Mist thickening at 23h.
Thursday ...	4		3·0	9·5	Foggy till 3h. then nearly cloudless. Clouding 5h. to nearly overcast. Clearing 11¼h. to few clouds. Cloudless 18h. till 22h., overcast by 22½h. Mist or fog from 18h.
Friday ...	5		1·5	9·5	Overcast till 9h.; very cloudy till 16½h., then nearly cloudless. Overcast from 21¼h. Mist or fog till 23h.
Saturday ...	6		0·0	9·4	Overcast throughout. Damping 8h. till 10h., and 18h. till 23h. Slight mist generally.
			Sum 5·7	Sum 67·1	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·61 ins. at the beginning of the week to 29·64 ins. by 8½h. on Oct. 31st; decreased to 29·32 ins. by 16h. on Nov. 1st; increased to 30·07 ins. by 23h. on Nov. 5th; decreased and was 29·92 ins. by midnight on Nov. 6th.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

All prices are net. Those in brackets include postage

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 13th NOVEMBER, 1937

BIRTHS AND DEATHS.

In the 124 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-fifth week of the year numbered 6,036 corresponding to an annual rate of 14·9 per 1,000 living: stillbirths numbered 229 corresponding to a rate of 37 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,215 (240 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 55, against 56, 51 and 52 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,165 live births registered corresponding to an annual rate of 14·7 per 1,000 living: stillbirths numbered 39 corresponding to a rate of 32 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 804 (63 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 47 against 38, 32 and 34 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 13th November, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l)	Other diseases (*see* note at head of table).

The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for ges in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those ished for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the nts.

The figures for the Great Towns in the weekly columns relate to 124 Towns. The comparable totals for the years 1936 and in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·92 ins. at the beginning of the week to 29·84 ins. by 15h. on Nov. 7th; increased to 30·02 ins. by 20h. on Nov. 9th; decreased to 29·82 ins. by 16h. on Nov. 10th; increased to 30·08 ins. by 0h. on Nov. 13th; decreased and was 29·91 ins. by midnight on the same day.

NUTRITION

A DIETARY SURVEY IN TERMS OF THE ACTUAL FOODSTUFFS CONSUMED. Special Report No. 218. Price 1*s.* (1*s.* 2*d.*).

The Authors have re-worked data secured during dietary surveys of St. Andrews, Cardiff and Reading in order to throw some light on the question "What are the amounts of various food materials actually consumed by the people of this country?" Among the topics of outstanding interest in the Report are—The suggestion that the Calorie standard of 3,000 Calories may be unnecessarily high, and the scope for education of the housewife in the selection and preparation of food, so that the highest nutritional return may be obtained for the money expended.

DIETS FOR BOYS DURING THE SCHOOL AGE. By H. C. Corry Mann, O.B.E., M.D. Special Report No. 105. Price 2*s.* 6*d.* (2*s.* 8*d.*).

A report indicating the relative value of the addition of milk, butter, vegetable margarine, sugar, watercress, etc., to the basic diet of a number of boys in an institution near London.

THE NUTRITIVE VALUE OF FRUIT, VEGETABLES AND NUTS. Special Report No. 213. Price 2*s.* (2*s.* 2*d.*).

What is the real nutritive value of fruit, vegetables and nuts, and how is this value affected by cooking? A notable contribution towards a correct answer to this question is made in this extensive investigation undertaken by Dr. R. A. McCance and his colleagues at King's College Hospital, London.

THE STANDARDISATION AND ESTIMATION OF VITAMIN A. Special Report No. 202. Price 1*s.* (1*s.* 2*d.*).

A collection of technical information, not available elsewhere, concerning the properties and use of the international vitamin A standard. It is intended for the information of competent workers already practised in the usual methods for the quantitative estimation of the vitamin.

VITAMINS: A Survey of Present Knowledge. By a committee appointed jointly by the Lister Institute and Medical Research Council. Special Report No 167. Price 6*s.* 6*d.* (7*s.*).

A detailed and authoritative statement of all the facts of importance relating to vitamins: their classification, distribution in nature, and function in nutrition: the diseases or other ill effects caused by diets deficient in the several vitamins.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 20th NOVEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-sixth week of the year numbered 5,902 corresponding to an annual rate of 14·5 per 1,000 living: stillbirths numbered 260 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 4,833 (618 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58, against 51, 52 and 55 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,231 live births registered corresponding to an annual rate of 15·5 per 1,000 living: stillbirths numbered 45 corresponding to a rate of 35 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 944 (140 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 44 against 32, 34 and 47 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 20th November, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

ble 5.—Meteorology in certain Towns during the Week ended Saturday, 20th November, 1937.

DATE. November, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	14		0·5	9·0	Cloudless. Thin cloud prevalent between 13h. and 19h. Mist 5h. till 8h. then fog till 13h. and again from 18h. Lunar halo 18½h. Hoar frost in morning.
Monday ...	15		0·0	8·9	Cloudless till 11½h. Few clouds till 15h.; overcast by 17h. Fog from 8h. till 19h.; then thick fog. Hoar frost in morning.
Tuesday ...	16		0·6	8·8	Fog clearing 0½h. then overcast. Nearly cloudless from 5h. Very cloudy 12½h. till 16h. then few thin clouds. Sky veiled from 22h. Foggy 6½h. till 17h. Lunar halo general from 18h.
Wednesday ...	17	Discontinued.	0·0	8·8	Thin cloud and lunar halo till 3h., then nearly overcast. Overcast from 9½h. Drizzle or slight drizzle from 12½h. Mist from 15h.
Thursday ...	18		0·0	8·8	Overcast throughout. Damping till 3h., then drizzle from 8½h. till 9h. Damping 12h. till 20h., then drizzle. Misty.
Friday ...	19		5·1	8·7	Overcast till 8h. Partially cloudy till 16½h., then nearly cloudless. Rain till 5h. Solar halo 11¾h. Dew at night.
Saturday ...	20		0·4	8·7	Nearly cloudless till 7h.; overcast by 8½h. Nearly overcast 10½h. till 17½h.; cloudless by 19h. Mist or fog from 8h. Dew in morning; hoar frost at night.
			Sum 6·6	Sum 61·7	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·91 ins. at the beginning of the week to 29·90 ins. by 16h. on Nov. 14th; increased to 29·99 ins. by oh. on Nov. 16th; decreased to 29·01 ins. by 4h. on Nov. 19th; increased and was 29·70 ins. by midnight on Nov. 20th.

MEDICAL RESEARCH

Some recent reports obtainable from

H.M. STATIONERY OFFICE

The Medical Uses of Radium. *Medical Research Council.* (*Special Report No.* 226.)

A Summary of the researches during 1936 with radium distributed by the Medical Research Council to selected centres. An account is given of the series of laboratory experiments on the fundamental aspects of irradiation and the biological effects of radium on cells and tissues. Particulars are also given of new methods used clinically for the radium treatment of cancer and some other diseases. An important feature is the statistical record of the after-histories of cancer patients who had been treated by radium in earlier years.

Some Quantitative Aspects of the Biological Action of X and Gamma Rays, by C. M. Scott. *Medical Research Council.* (*Report No.* 223.)

A quantitative study of the action of X and gamma rays on different types of living cells has important bearings on the use of the rays in the treatment of cancer. Dr. Scott in the report now presented has made an excellent analysis of the physical and biological problems involved, and summarises such attempts as have been made at solving them. He then describes briefly his own ingenious and well-planned experiments and concludes with an interesting and informative discussion on the results obtained.

Roy. 8*vo.* 99 *pp.* 1*s.* 6*d.* (1*s.* 8*d.*).

The Development of Cardiac Enlargement in Diseases of the Heart. *Medical Research Council.* (*Special Report No.* 222.)

The present study was carried out in the Cardiac Department of the London Hospital in order to determine what might be learned about the development and progress of cardiac enlargement from a series of patients in whom X-ray records had been made at intervals ranging from weeks to years. The cases were studied by means of teleradiograms and they were selected to show the ultimate effects upon the heart's size of such major events as persistently increased heart-rate, high blood pressure, congestive failure, and coronary thrombosis. The grouped descriptions of cases should have permanent value in providing for reference direct examples and clear details of changes of the heart's size in many different types of patient.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 27th NOVEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-seventh week of the year numbered 5,776 corresponding to an annual rate of 14·2 per 1,000 living: stillbirths numbered 255 corresponding to a rate of 42 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,404 (571 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 63, against 52, 55 and 58 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,118 live births registered corresponding to an annual rate of 14·1 per 1,000 living: stillbirths numbered 43 corresponding to a rate of 37 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,119 (175 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 58 against 34, 47 and 44 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 27th November, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases :—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

DATE. November, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	21		0·6	8·6	Cloudless; dense fog from 8½h. till 12h., then fog. Partially cloudy 14½h. till 20h., then overcast. Fog till 18h., then mist till 23h.
Monday ...	22		0·0	8·6	Nearly overcast or overcast. Hoar frost in morning. Mist in evening. Rain 23½h. till 23⅝h.
Tuesday ...	23		0·7	8·5	Overcast till 9h.; cloudy till 17h., then nearly overcast. Rain 1½h. till 4⅝h. Mist at night.
Wednesday ...	24	Discontinued.	0·3	8·5	Overcast till 10h.; very cloudy till 17h. clearing 17½h., cloudless by 18h. Mist in morning.
Thursday ...	25		2·8	8·4	Cloudless or nearly so. Foggy 6½h. till 22h., dense between 8h. and 10h. Hoar frost in morning.
Friday ...	26		3·0	8·4	Cloudless generally. Fog from 9h. till 19h., then thick fog. Hoar frost in morning and at night.
Saturday ...	27		0·2	8·3	Thick fog till 12h., then clearing rapidly. Nearly overcast and slight mist till 20½h. nearly cloudless period till 22h.; nearly overcast again by 0h.
			Sum 7·6	Sum 59·3	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and — "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased generally from 29·70 ins. at the beginning of the week to 30·21 ins. by 23h. on Nov. 25th; decreased to 29·97 ins. by 4h. on Nov. 27th; increased and was 30·24 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 4th DECEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-eighth week of the year numbered 5,806 corresponding to an annual rate of 14·3 per 1,000 living: stillbirths numbered 298 corresponding to a rate of 49 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,461 (57 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 64, against 55, 58 and 63 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,111 live births registered corresponding to an annual rate of 14·0 per 1,000 living: stillbirths numbered 53 corresponding to a rate of 46 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,171 (52 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 65 against 47, 44 and 58 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 4th December, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30·24 ins. at the beginning of the week to 30·36 ins. by 10h. on Nov. 28th; decreased to 28·96 ins. by 14h. on Dec. 2nd; increased to 29·66 ins. by 7h. on Dec. 4th; decreased and was 29·18 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 11th DECEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the forty-ninth week of the year numbered 5,570 corresponding to an annual rate of 13·7 per 1,000 living: stillbirths numbered 259 corresponding to a rate of 44 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,244 (217 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 65, against 58, 63 and 64 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,124 live births registered corresponding to an annual rate of 14·2 per 1,000 living: stillbirths numbered 40 corresponding to a rate of 34 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 994 (177 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 60 against 44, 58 and 65 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 11th December, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 11th December, 1937.

(Supplied by the Meteorological Office.)

DATE. DECEMBER, 1937		ATMOSPHERIC ELECTRICITY. (For explanation of symbols, *see* Note.)	Registered Sunshine in hours.	Sun above Horizon in hours.	GENERAL REMARKS.
Sunday ...	5		0·0	8·1	Overcast; nearly so from 12½h. Clearing 16½h., few clouds by 18h., cloudless from 19h. Occasional slight rain from 0½h.; continuous 3¾h. till 8¾h. Intermittent rain 12h. to 15h. Hoar frost at night.
Monday ...	6		0·0	8·0	Cloudless till 8h., then overcast and fog. Hoar frost throughout.
Tuesday ...	7		0·0	8·0	Overcast and fog till 18h., cloudless by 19h. Nearly overcast from 21¼h. Hoar frost in morning.
Wednesday ...	8	Discontinued.	0·0	8·0	Very cloudy till 5h., then overcast. Sleet 5¾h. till 6h. and about 21h. Intermittent slight rain 6h. till 17½h., then rain till 23¾h. Misty.
Thursday ...	9		0·0	8·0	Overcast; few breaks between 16½h. and 21h. Occasional rain from 3h. till 13¼h., with sleet at times from 8h. Slight rain 17h. 50m. till 18½h. Misty.
Friday ...	10		0·0	8·0	Overcast. Cloud thinning and clearing 12½h., becoming overcast again by 17¼h. Rain from 18¼h. Mist in forenoon.
Saturday ...	11		0·8	7·9	Overcast or nearly so. Cloudy periods 1h. till 8h., and 13h. till 15h. Rain till 0½h., and frequently from 9¾h. till 11¼h.
			Sum 0·8	Sum 56·0	
No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·18 ins. at the beginning of the week to 29·07 ins. by 6h. on Dec. 5th; increased to 29·42 ins. by 21h. on Dec. 8th; decreased to 29·33 ins. by 6h. on Dec. 9th; increased to 29·67 ins. by 9h. on Dec. 10th; decreased to 29·06 ins. by 15h. on Dec. 11th; increased and was 29·20 ins. by midnight on the same day.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 18th DECEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the fiftieth week of the year numbered 6,037 corresponding to an annual rate of 14·9 per 1,000 living: stillbirths numbered 294 corresponding to a rate of 46 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,881 (637 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 74, against 63, 64 and 65 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,195 live births registered corresponding to an annual rate of 15·0 per 1,000 living: stillbirths numbered 38 corresponding to a rate of 31 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,209 (215 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 76 against 58, 65 and 60 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 18th December, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 29·20 ins. at the beginning of the week to 29·45 ins. by 19h. on Dec. 12th; decreased to 28·71 ins. by 23h. on Dec. 13th; increased to 29·96 ins. by 2h. on Dec. 18th; decreased and was 29·93 ins. by midnight on the 18th.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 25th DECEMBER, 1937

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the fifty-first week of the year numbered 5,019 corresponding to an annual rate of 12·4 per 1,000 living: stillbirths numbered 268 corresponding to a rate of 51 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 5,711 (170 less than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 72, against 64, 65 and 74 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,004 live births registered corresponding to an annual rate of 12·6 per 1,000 living: stillbirths numbered 37 corresponding to a rate of 36 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,105 (104 less than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 64 against 65, 60 and 76 in the preceding three weeks.

ERRATA

REGISTRAR-GENERAL'S WEEKLY RETURN No. 50.

Week ended 18th December, 1937.

Page 1267. Table 3. Jarrow M.B.

Notifications of Enteric should read :—nil.

Pneumonia should read :—1.

Page 1279. Table 3. Hawarden R.D.

Notifications of Pneumonia should read :—1.

(46618)

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 25th December, 1937, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

No. of Column ...		25	26	27	

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer decreased from 29·93 ins. at the beginning of the week to 29·83 ins. by 13h. on Dec. 19th; increased to 29·92 ins. by 10h. on Dec. 20th; decreased to 29·68 ins. by 13h. on Dec. 21st; increased and was 30·49 ins. by midnight on Dec. 25th.

EXPLANATORY STATEMENT

TABLE I shows, for London and the County Boroughs and those urban districts with resident populations exceeding 50,000 at the last Census, the number of births and deaths (distinguishing deaths from certain causes and those of infants under one year of age) for the week ended last Saturday. The births relate to those registered in the area, but include births occurring in municipal maternity hospitals situate outside the area to which they belong.

The deaths are exclusive of non-residents but corrected as far as possible by the inclusion of deaths of residents in other areas. The deaths in Edinburgh and Glasgow are fully corrected for non-residents; those in Dublin and Belfast are corrected by the exclusion of deaths of non-residents occurring in public institutions.

TABLE 2 shows the deaths in London at ages and by causes of death and by cause in the current year to date with corresponding figures for the previous year.

TABLE 3 is a summary of cases of certain specified infectious diseases in England and Wales notifiable under the general law or under orders made by the Local Government Board or Minister of Health and is based upon weekly returns received from the Medical Officers of Health of all Local (and Port) Sanitary Authorities.

The names of districts in respect of which "Nil" returns have been received indicating that no cases of the specified infectious diseases have been notified during the week, are *omitted* from this Summary.

TABLE 3A is similar to Table 3, but relates to the returns received too late for inclusion in Table 3 of the previous week. It includes revised figures for England and Wales as a whole for that week.

TABLE 4 shows for (*a*) London and (*b*) the Great Towns in the aggregate the births, deaths (distinguishing those of infants under one year of age) and numbers of notified cases of and deaths from certain diseases in each of the preceding thirteen weeks and in the current year to date with corresponding figures for the previous year.

TABLE 5 is a Report of the meteorological conditions in certain towns for the week as a whole.

TABLE 6 is a Report of the meteorological observations taken at Greenwich on each day of the week.

Summaries of the information, adjusted in respect of any returns or corrections received too late for the weekly issues, are published in the Registrar-General's Quarterly Return and the Statistical Review (Part I).

NOTES FOR THE WEEK ENDED 1st JANUARY, 1938

BIRTHS AND DEATHS.

In the 125 **County Boroughs and Great Towns** of England and Wales the live births registered in the fifty-second week of the year numbered 5,790 corresponding to an annual rate of 14·3 per 1,000 living: stillbirths numbered 237 corresponding to a rate of 39 per 1,000 total births registered (including stillborn): the deaths (excluding stillbirths) corrected as far as possible for non-residents numbered 6,330 (619 more than in the preceding week).

Infant mortality, based on the average weekly number of live births during the last 52 weeks, was 87, against 65, 74 and 72 in the preceding three weeks.

In **London** (Administrative County including the City of London) there were 1,166 live births registered corresponding to an annual rate of 14·7 per 1,000 living: stillbirths numbered 34 corresponding to a rate of 28 per 1,000 total births (including stillborn): the deaths (excluding stillbirths) numbered 1,282 (177 more than in the preceding week): infant mortality, based on the average weekly number of live births during the last 52 weeks, was 83 against 60, 76 and 64 in the preceding three weeks.

Table 3.—Notifications of Infectious Diseases.

Number of cases notified in the week ended 1st January, 1938, in Administrative Areas and Port Sanitary Districts with Summary for England and Wales.

Note.—Where no return has been received a * is inserted in the columns. Totals shown against the names of Counties include any associated County Boroughs. The letters in the last column denote the following diseases:—A, Cholera; B, Plague; C, Puerperal fever, (London A. C. only)†; D, Cerebro-spinal fever; E, Acute poliomyelitis; F, Acute polio-encephalitis; G, Acute encephalitis lethargica; H, Typhus fever; I, Relapsing fever; J, Continued fever (London A. C. only)†; L, Dysentery; M, Ophthalmia neonatorum; N, Puerperal pyrexia (including fever in all areas except London A. C.)

† The Public Health Act, 1936, provides that on and after 1st October, 1937 in all areas *outside London Administrative County* (1) the obligation to notify cases of Puerperal pyrexia shall include the obligation to notify conditions previously notifiable as Puerperal fever, and (2) Continued fever shall not be regarded as a notifiable disease.

—	Small-pox.	Scarlet fever.	Diphtheria.	Enteric (typhoid & paratyphoid) fever.	Acute pneumonia (prim'y or influenz'l).	Other diseases (*see* note at head of table).

* The figures in this Table relate to the areas as constituted at the date of the weekly returns no corrections having been made for changes in boundary. The live births are derived from the weekly returns furnished by the Registrars and differ from those published for the towns in the Quarterly Return which are corrected for births occurring away from the usual residence of the parents.

† The figures for the Great Towns in the weekly columns relate to 124 Towns up to and including the week ended 13th Nov., and thereafter to 125 Towns. The comparable totals for the years 1936 and 1937 in the last two columns are in respect of 121 Towns to the end of March and 122 Towns thereafter.

Table 5.—Meteorology in certain Towns during the Week ended Saturday, 1st January, 1938.

The results apply to the Civil Day, or from midnight to midnight, Greenwich Mean Time. The height of the cistern of the barometer is 152 feet above the mean level of the sea; no correction has been applied to the readings to reduce to sea level.

Observations are usually taken at 9h. A.M., noon, 3h. P.M., and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer and the wet bulb thermometer are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the 50 years ending 1903. With the corrected mean reading of the dry bulb thermometer, is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of the temperature of the air (column 7). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb thermometers by Hygrometrical Tables, published by the Meteorological Office, Air Ministry.

The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 65 years ending 1905, and that of horizontal movement of the air from a discussion of the anemometric records for the 50 years ending 1916. In reading columns 8 and 23 it will be borne in mind that + indicates "*higher*" and − "*lower*" than the average.

The values given in column 16 are not corrected for the index error of the thermometer, which cannot be determined.

The numbers in column 26, derived from the Campbell Stokes sunshine Instrument show the aggregate duration of *bright* sunshine on each day.

The reading of the barometer increased from 30·49 ins. at the beginning of the week to 30·55 ins. by 20h. on 26th; decreased to 30·23 ins. by 5h. on 29th; increased to 30·32 ins. by 19h. on 30th; decreased to 30·15 ins. by 7h. on Jan. 1st; increased and was 30·20 ins. by midnight on same day.
